

Moment Seismic Inversion with
ISOLA of the 2013-08-13
Earthquake at the Colombian
Pacific Ocean.

Tectonic Setting

Recovered from: Missing history (16-71 Ma) of the Galápagos hotspot: Implications for the tectonic and biological evolution of the Americas. *Geology*, September, 2002, v. 30, p.795-798

Event Location Station Selection

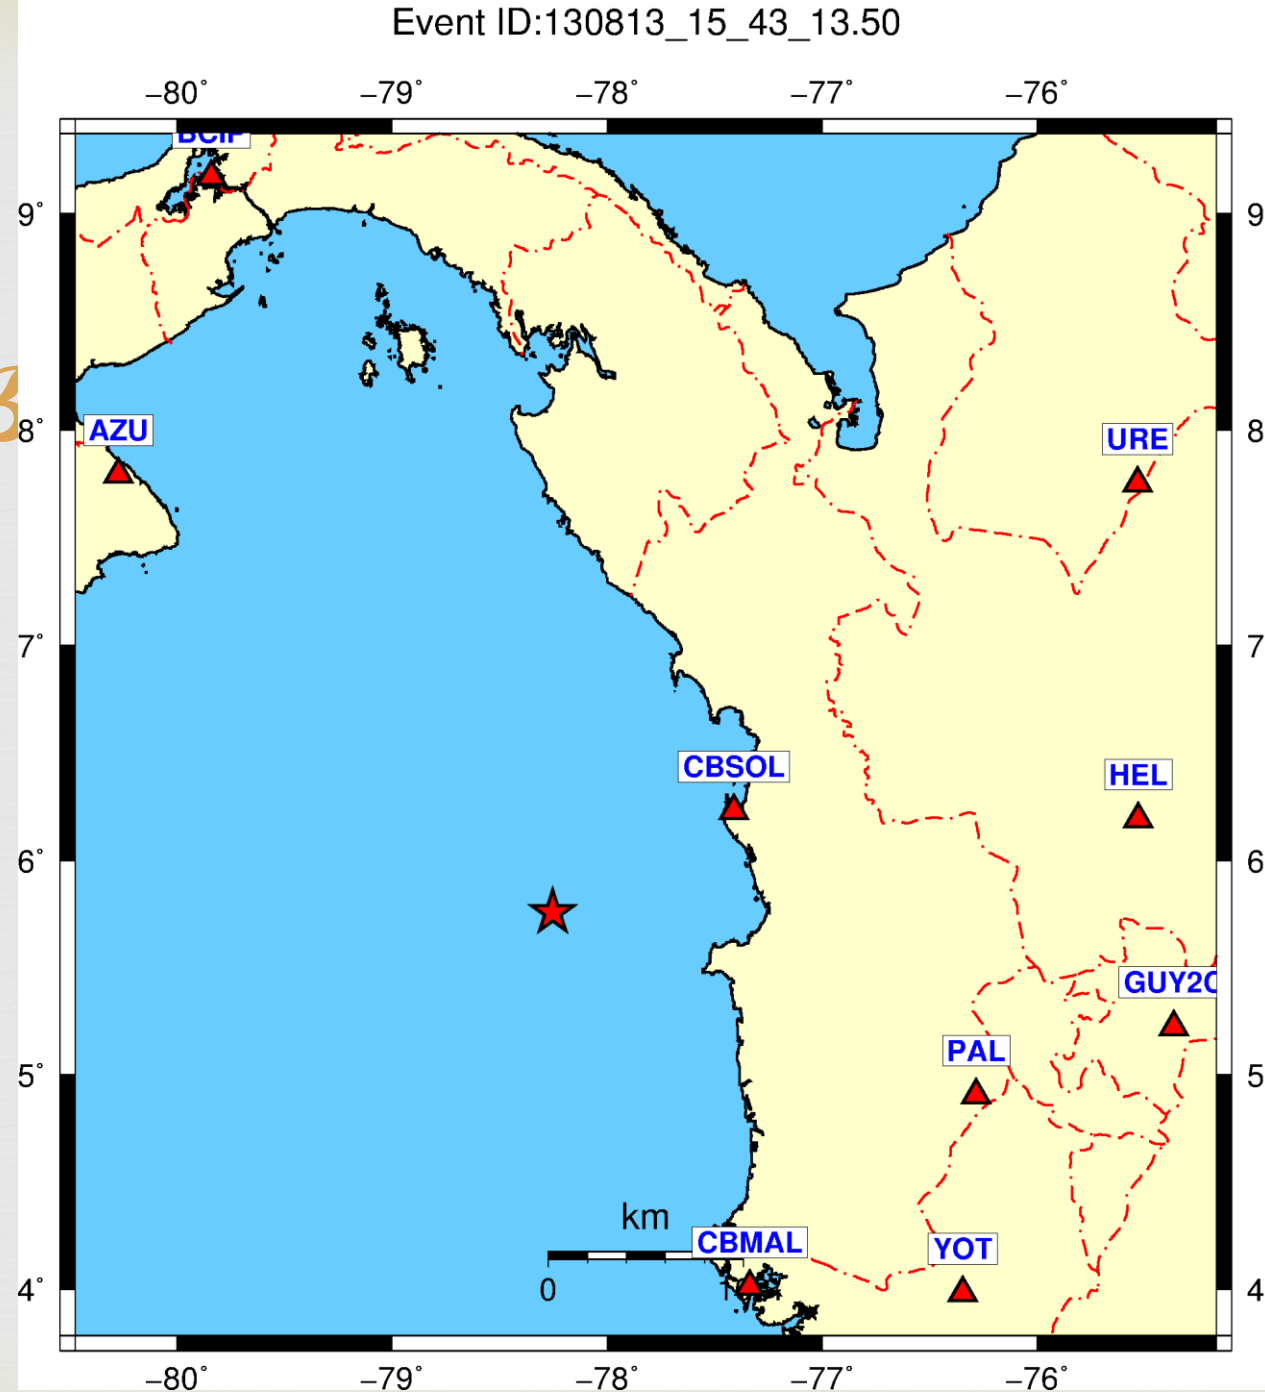

Epicenter event location.

Latitude: 5.755

Longitude: -78.254

Depth: 12.3 km

Magnitude: 6.5 Mw

Quality assess

- ❧ For the inversion was used 9 stations, 2 of this are accelerographs.
- ❧ After assess the quality of the data, the 7 seismograph station were chosen and only one of the accelerograph stations.
- ❧ Frequency range used
 - ❧ Seismograph stations
 - ❧ 0.01-0.02 0.04-0.05
 - ❧ Accelerograph stations
 - ❧ 0.05-0.06 0.09-0.1

NP2: 118 45 -21

CMT SOLUTION

Outcome

- ❧ The inversion show up a good correlation between the real data and the synthetic data for the Colombian stations.
- ❧ The best depth centroid location is at 14 km using the frequency range described before and with this the variance obtained is 0.61.
- ❧ After doing a lot of test using different frequency ranges, it was achieve to the best solution.
- ❧ The search through the planes in depth is in standby and it is going to be reported in future presentations.

WE ARE SO GRATEFUL FOR ALL YOUR PATIENT
AND YOUR DEDICATION TO ACHIEVE
THE GOAL OF THE COURSE.
THANK YOU VERY MUCH.
